Telemetry & Remote SCADA Solutions

Make the most of your remote assets
Telemetry and SCADA systems allow you to monitor and control field operations across a widely dispersed infrastructure. From simple reservoir level measurement to well pad optimisation integrated with ERP, these systems are constantly challenged by emerging regulations, rapid technology change and industrial trends.

The Challenges of Managing...

- Enterprise Asset Management
- Integrated Systems
- Control Room Operation
- Process Monitoring & Automation
- Field Devices
Remote Operations

Adaptation
As our world becomes increasingly wireless, from communication devices to entertainment equipment, so too is the trend for managing processes in difficult and/or hazardous locations. While reliable connectivity, autonomous power and ease-of-use are just three of a long list of benefits that wireless has over traditional wired solutions, significant cost and maintenance reductions are often the most influential drivers.

Security
Few industries require security more than those concerned with the protection of natural resources and the management of energy. While the use of remote monitoring and control in critical processes continues to evolve, so does the need for enhanced security. Whether it is a measured value at a field instrument or the data path to the host, informational integrity can only be realised through focus on end-to-end data security.

Regulatory Requirements
Increased attention to safety and compliance with emerging regulations are major design factors for telemetry and SCADA systems today. Governments on both federal and municipal levels continue to push for higher standards in water quality, affordable energy, and the well managed distribution of both in a manner that sustains our natural environment.

Process Optimisation
Without data there is no process knowledge and without effective measurement and information transfer there is no data. Remote process optimisation can only be effective when all necessary points are monitored and all data safely transferred to stakeholders, whether human or machine.

Schneider Electric helps you face remote operation challenges with integrated, secure and reliable end-to-end Telemetry and Remote SCADA Solutions.

Leveraging a proven track record in a wide range of industries and expertise in the areas of instrumentation, control and data acquisition, wireless communication and IT, Schneider Electric Telemetry and Remote SCADA Solutions can help make the most of your remote operations and assets.
Controlling cost of ownership

Process monitoring and telemetry operations at remote sites are commonly spread across a wide area with equipment being exposed to harsh environments, making access difficult. In comparison to capital costs, the installation, operation and maintenance of these systems is often the most significant overall expense factor in the long term. With scalability, flexibility and ease-of-use in mind, Schneider Electric’s telemetry and SCADA solutions are tailored to help lower this total cost of ownership.

Rapid deployment wireless instrumentation

Accutech field instruments are easy to install being self-contained with power, radio and sensor. With the elimination of cabling, trenching and conduit, deployment costs are reduced by up to 75% relative to wired alternatives. Together, the high performance, long reach, license-free radio and long lasting battery reduce support costs while delivering valuable data.

Easy to use data radio solutions

Trio licensed and license-free data radios offer versatile wireless field networking solutions for point-to-point and point-to-multipoint networks. High performance is offered in each of a wide range of cost effective product lines including frequency hopping radios, simplex and half duplex remotes, redundant base stations and store and forward repeaters. Trio’s flexible feature set and intuitive design enable greater choice in network functionality and ease of use.
Flexible and efficient
Smart RTUs

SCADAPack Smart RTUs offer flexibility through a wide range of features and options, and are easy to network, program and maintain. They also control operating costs by keeping you out of the field with online configuration and editing of logic applications either through a dedicated development environment or through our ClearSCADA host software. Innovative circuitry and firmware designs result in ultra-high efficiency modes that suit the challenges of solar powered SCADA.

Effective and intelligent
SCADA Host

ClearSCADA is recognised as the most innovative, flexible and complete SCADA host platform available today. From a built in historian to alarm redirection, from object-based templates to multi-developer environments, ClearSCADA is designed to control operational costs through quick deployment and reduced down time, all in a secure, easy to use environment.
Secure and reliable SCADA...

Safety and availability are must-have characteristics of critical infrastructure, both being dependent on their resistance to outside forces such as cyber attacks and natural disasters. This especially holds true when considering security for SCADA systems which monitor and control remote operations through a wide array of communications technologies, often choreographed by a central host. At Schneider Electric, our telemetry and remote SCADA solutions incorporate solid security at all levels, from the field to the enterprise.

Protection that starts at the source

Using DNP3 protocol with AGA12-2 message encryption helps to ensure your data is not tampered with over remote connections, from the controller to the SCADA host. With DNP3 secure authentication only authorised devices are able to request execution of critical commands such as setting outputs, transferring files, or changing controller configuration.

Security from the control room and remote clients

ClearSCADA Host software is continuously tested against the most recent security regulations and cyber threats. Secure account and password management let you decide right down to the object level who gets to see and control which data points within a SCADA system. Users or user groups are assigned password protected levels of access for specific features, including configuration, operation, alarms and database navigation. Object permissions are automatically carried over when new instances are created from templates that provide efficient scalability with reduced risk of error.
...across wide area networks

When it comes to managing multiple remote sites the communication of data between field operations and the control room becomes even more critical in making operational decisions. Schneider Electric’s telemetry and SCADA solutions include functionality that helps ensure your data is delivered reliably, securely and without loss.

Reduce risk of data loss

Whenever remote data points change, the SCADAPack E Smart RTU stores a time-stamped DNP3 event which remains in its data queue until polled or reported. This allows the ClearSCADA host to poll less often and still obtain a continuous record of data history even when communication links go down.

High level of data availability

ClearSCADA offers dual or triple redundant servers, disaster recovery sites and remote performance servers to ensure data availability. Even LAN/WAN links and connections to remote controllers can be configured for redundant paths over different media.

Reliable wireless connectivity

SmartPath™ technology used in Trio radios lets system designers create a network topology that offers alternative radio link paths. The result is enhanced connectivity and redundancy without the message latency common in more traditional MESH technologies. Together with a wide range of models and performance enhancing features Trio radios provide the ultimate flexibility in reliable and secure data radio connectivity.
> Gain operational efficiency from field...

Whether close by or at a great distance, your assets provide a wealth of information that is critical to operational efficiency. From simple measurements to historical logs, every bit of information is valuable. The easier it is to capture the more likely your operations team will make use of it. Schneider Electric's telemetry and remote SCADA solutions allow you to transform data into directly usable information through seamless integration of assets, from the RTUs in the field to your centralised business systems.

Easy access to business systems

ClearSCADA is an open object-oriented platform with a rich suite of industry standard interfaces including SQL (ODBC or OLE-DB), OPC and .NET giving any reporting package, such as an MIS or ERP business system, easy access to the real-time database, alarm/event journal and historian.

Automatic recognition, less configuration

Tight integration across telemetry and SCADA network components can yield significant operational advantages if the host software is included. ClearSCADA offers pre-configured templates that are easy to setup and SCADAPack-specific objects that require less configuration while providing access to more detailed data. With the ability to detect a newly added SCADAPack Smart RTU ClearSCADA can automatically download the required control applications and configuration. Subsequently, with automatically synchronised clocks, SCADAPack data logs are seamlessly retrieved into the ClearSCADA historian.

A very powerful result of the object-based architecture is that any changes to the ClearSCADA database can be made online, and do not result in operational stoppages.
Real-time monitoring of network health

Effective networks offer efficiency and reliability when they are working properly, but to know this you need real-time access to network health information at all points of the system. When used with ClearSCADA, our products offer direct access to network communication statistics from RTUs, data radios and field instruments as well as specific health indicators like battery status, RSSI and temperature.

Escalated notification of alarms

Configured alarms are the most important aspect of any process monitoring but are only useful if the notification gets to the right person or machine. ClearSCADA host software and FlowStation controllers provide escalated notification based on a wide range of configuration variables. If an alarm is not acknowledged within a set period of time by the console operator it can be automatically passed to the field operator. If that doesn’t work the alarm is forwarded to maintenance personnel and so on. Web clients, SMS and Blackberry browser interfaces are available to provide remote access to alarms.
Minimise risk by improving safety...

Natural gas production and distribution, the supply of potable water and the handling of wastewater, the transfer of electrical energy across great distance; these are all industries with increasing requirements for operational safety, compliance with environmental regulations and the overall security of assets. Schneider Electric’s telemetry and remote SCADA solutions address all of these critical requirements through flexible end-to-end integration and comprehensive feature sets.

Prevention through knowledge

Accutech wireless instruments provide critical information by monitoring process variables that were previously out of reach for physical and/or cost reasons. Whether it is gas leak detection with an acoustic monitor, tank level measurement with the SL10 submersible or door/hatch access detection with the SI10 switch input device, Accutech provides the enhanced process knowledge you need to prevent critical incidents.

Gas leak detection with Accutech acoustic monitor
...and regulatory compliance

Compliance through secure data

For applications requiring traceability Schneider Electric’s SCADA solutions provide extensive data logging features to ensure regulatory requirements for history can be met. SCADAPack Smart RTUs offer periodic or sudden burst high-speed data logging along with both onboard and external memory options. The SCADAPack E Smart RTUs, when used with the DNP3 protocol and ClearSCADA, offer automatic data back-filling in case the communications network to the host is interrupted.

Assurance through certification

Accutech instruments, SCADAPack Smart RTUs and Trio radios are all designed for installation in remote environments with high humidity and extreme temperatures. All our products are certified for hazardous and/or explosive areas, while our gas flow computers are API 21.1 compliant and approved for custody transfer applications.

Event-driven video security

ClearSCADA’s integrated video reporting engine adds video security to your asset management applications. This cost-effective solution preserves network bandwidth by using event driven video clips triggered at the RTU.
> Making the most of your production assets

Our telemetry and remote SCADA solutions go beyond remote monitoring and control by providing you the means to quickly develop and maximise the performance of your production assets. Specifically in oil & gas, Schneider Electric has a solution that optimises your investment by extending well lifetime and increasing production.

Well Production Optimisation

ProductionPlus is an integrated hardware and software solution for gas production optimisation. Used in single well or multi-well pads ProductionPlus measures and controls gas flow while monitoring separated liquids in storage tanks. Flow control modes that extend well life include manual, intermittent and plunger lift.

This combined control and optimisation platform runs on a SCADAPack gas flow computer while offering an easy to configure interface via local display panel, remote PC, or at the SCADA host. Many features are integrated and configurable, such as well shutdown based on storage tank levels, while others may be introduced using user developed logic.

The value of ProductionPlus is further enhanced when combined with our full suite of SCADA products. For measuring wellhead pressures and tank levels Accutech wireless instruments are seamlessly integrated into the ProductionPlus platform. Trio data radios provide connection from each well pad to the ClearSCADA host which includes pre-packaged ProductionPlus templates that monitor each well and provide high resolution trending and plunger arrival history.

From operator to the asset manager, benefits are seen at all levels:

- **Operators** – local display provides access to all wells from one point.
- **Automation Technician** – access to control and EFM data using standardised templates for rapid deployment.
- **Production Supervisor** – regulatory compliance and timely production data for delivery commitments and forecasting.
- **Production Analyst** – high resolution operational measurements, detailed plunger arrival log and proven optimisation methodologies.
- **Asset Manager** – new gas opportunities maximised during flow-back period with same day wireless measurements.
Telemetry & Remote SCADA Solutions

Applications

Oil & Gas
- Wellhead automation & management
- Production optimisation & well life extension
- Gas flow measurement
- Tank battery management
- Salt water disposal wells
- Pipeline monitoring of compressor station control
- Wireless sensors and communication
- Flare monitoring
- Safety pressure monitoring
- Corrosion & leakage monitoring

Water & Waste water
- Wireless communications
- Well monitoring & control
- Water quality monitoring & data logging
- SCADA software
- Pumping station controller
- Pressure distribution system
- Irrigation monitoring
- Storm water monitoring
- Lift station controller

Clear
Host software application template processes and O&G integration to Accutech, SCADA and Trio products.

ProductionPlus
Integrated hardware and software solution that increases safety, improves environmental compliance and extends well life.

Realflo
Gas flow measurement software and hardware solutions

Accutech
Wireless instrumentation eliminates costly hard-wired installations with self-powered, easy-to-install field units

SCADA Pack
Smart RTUs and gas flow computers combine the monitoring and communications capabilities of an RTU with the processing and data-logging power of a PLC.
Clear SCADA

Host software providing application templates for W&WW processes and O&G production and integration to Accutech, SCADA and Trio products.

ProductionPlus

Integrated hardware and software solution that increases safety, improves environmental compliance and extends well life.

FlowStation

A complete pump station controller designed for use in storm and waste water lift stations and pump-up applications.

Trio

Industrial-strength data radios bring ease-of-use, flexibility and advanced performance to the most demanding SCADA applications.

SCADA Pack

Smart RTUs and gas flow computers combine the monitoring and communications capabilities of an RTU with the processing and data-logging power of a PLC.
